

# MENGM0056 - Product and Production Systems

## Scenario 3: FMCG - Bottled Beverage (500 ml)

Hand-out for Group Coursework (2025/26)

**UUID seed:** f7aa12f6-8258-11f0-8de9-0242ac120002    **Checksum:** b8829bc4241c

### Purpose

This scenario considers a high-throughput beverage line with volatile demand and despatch congestion. Your task is to propose operational policies that stabilise service level and improve utilisation while controlling changeover losses and inventory.

### Narrative

A 500 ml carbonated soft drink is produced in PET bottles. The line comprises blow-moulding, filling, labelling, case-packing and palletising, with despatch to outbound trucks via limited loading bays. Demand varies with weather and promotions. CIP and changeovers consume valuable capacity. Capital spend is constrained; improvements should focus on scheduling, policies, and parameter changes.

### Entities and flow (fixed structure)

Preforms → Blow-mould → Fill → Cap → Label → Case-pack → Palletise → Despatch.

### Baseline parameters (seeded)

#### Global

Shifts per day	2
Shift length	7.5 h
Base daily demand	1901 cases/day (12 bottles/case)
Daily demand CV	0.22
Number of SKUs	5
On-time despatch target	95%

### Line capacities and availability

Resource	Count	Nominal rate	Availability
Blow-moulder	1	25068 bph	0.896
Filler	1	22972 bph	0.863
Labeller	1	22139 bph	0.902
Case-packer	1	1627 cph	0.857

Palletiser	1	1471 cph	0.942
------------	---	----------	-------

## Changeovers and CIP

CIP duration (flavour)	53 min
Additional flavour change operations	35 min
Label-only change duration	11 min
Minimum batch size	791 cases

## Despatch and yard logistics

Loading bays	2
Despatch window	7:00 – 19:00
Mean truck inter-arrival	73 min
Truck service time	46 min
Cases per pallet	108
Pallets per truck	26

## Reliability (downtime parameters)

Resource	MTBF (min)	MTTR (min)
BlowMoulder	657.9	23.5
Filler	317.4	23.3
Labeller	685.0	10.2
Packer	506.5	17.6
Palletiser	823.2	18.8

## Costs

Holding cost	£1.94 /pallet/day
Changeover cost (all-in)	£271.55 /event
Lateness penalty	£334.25 /late truck
Scrap cost (changeover/CIP)	£1.85 /case

## Required KPIs

- Line utilisation by unit (blow-moulder, filler, labeller, packer, palletiser).
- Changeover time and product loss per week; percentage of capacity lost to changeovers/CIP.
- Order lead time distribution and on-time despatch rate (service level).
- Loading-bay utilisation and maximum truck queue length; truck lateness count.
- Finished-goods days-of-cover and average pallets in buffer.

## Techniques to apply

- **Modelling & KPIs:** capacity model, bottleneck identification, changeover loss accounting.
- **Mathematical programming:** shift patterns, SKU sequencing and batch sizing subject to CIP and bay constraints.
- **Uncertainty modelling:** daily demand and truck arrivals; downtime distributions.

- **Simulation:** discrete-event model of the line and despatch yard; evaluate congestion and schedules.
- **Metaheuristic optimisation:** lot-sizing and sequence optimisation with changeover penalties and service-level targets.

## Improvement levers (examples)

- SKU sequencing to group labels and reduce full CIP events; threshold policies for label-only changes.
- Time-of-day despatch smoothing: reserve windows for large orders; dynamic bay assignment.
- Buffer targets before palletiser and before despatch to prevent starvation/blocking.
- Preventive maintenance windows aligned with expected demand troughs.

## Deliverables

1. A report (max 20 sides of A4 including figures and references; appendices unmarked but admissible as evidence).
2. The report should contain a production and despatch plan for one representative week, showing SKU sequence, batch sizes, and expected service level.
3. Model files (e.g., simulation, optimisation) as appendices/evidence.

## Assessment emphasis

Clarity and correctness of the capacity and KPI model; appropriate choice and justification of techniques; quality of experimental design; robustness to demand variability; and persuasiveness of recommendations under operational constraints.

## Data ethics and reproducibility

Report your UUID seed and any random seeds used within tools. Provide enough detail for independent regeneration of your parameter tables.
